A. Dial Up

B. Wifi

- **DNS server**

DNS server is a computer that translates the domain name of another computer into an IP(Internet Protocol) address and vice versa on request.

- **URL**

Using web browser you can move to specific page by typing its address. This address is also called URL (Uniform Resource Locator). A URL contains the tool to be used and the internet address where the information can be found.

3) Design a following table using table elements and other appropriate elements.

<u>Listing Element</u>				≥ ≤	
		©	®		
				TM	
<ul style="list-style-type: none"> • DNS • HTTP ▪ POP ▪ SMTP 				<u>Heading elements</u>	

Note: Listing element and Heading elements are external links that display page of heading elements and listing elements.

4) Give an example of image mapping.

5) Design a webpage consists of external and internal link pages. Use minimum 3 external and 2 internal links in a page.
